

Notes given by the student who is one of the collaborators for the cherry blossoms work and was working on it earlier, plus a few additional notes. You will have to also follow through on the notes mentioned in the scanned page below.

Just for clarification for using the right dataset -- for cherry blossoms.

The issue is as it is the longest known dataset for phenology in the world uptil now, and it is a somewhat famous dataset, there are some variants for the dataset.

Also there are two types of cherry blossom datasets:

1. one specific of only Kyoto station
2. Other one with 102 various stations in Japan.

The variants for each datasets are :

A. 102 stations from Japan:

(-- This is the sakura first and full bloom.. file named dataset given to you, which is useful to us.)

(i) JMA (Japan meteorological agency) datset (raw file): needs processing. Only from 1953 to 2015.

(ii) kaggle dataset: already processed -- which one I used.

B. For kyoto station:

Kaggle platform datasets: (pre processed)

<https://www.kaggle.com/datasets/ryanglasnapp/japanese-cherry-blossom-data/data>

This is the famous data set curated by Yasuyuki Aono, who passed away a few months ago:

<https://www.ncei.noaa.gov/pub/data/paleo/historical/phenology/japan/>

This is the rough note about various datasets. These would have to be checked first.
